

Practice interviews like they're real.

Adaptive AI interview practice for Product Management candidates.

01 · USER PROBLEM

Candidates have abundant content but limited access to realistic, adaptive practice. The opportunity is to make deliberate practice repeatable.

02 · TARGET USER

Students and early-career candidates preparing for PM internships, placements and entry-level roles.

03 · HYPOTHESIS

If the interviewer adapts to the candidate's reasoning and the debrief points to the next skill, users will find the session useful enough to complete and repeat.

04 · WHY AVATAR

The avatar creates interviewer context. It is a testable hypothesis, not a decorative feature. Compare avatar vs text-only on completion, perceived realism and repeat.

05 · MVP

Setup → Answer → Adaptive follow-up → Debrief → Next practice. P0 includes role/type/difficulty, voice/text, adaptive probing, six competencies, next-practice recommendation and AI disclosure.

06 · SUCCESS METRICS

North Star: completed interview sessions. Activation: first answer. Completion: 5+ answers. Repeat: second session. Outcome: feedback-driven next practice.

07 · GTM

Start with college placement communities, LinkedIn and peer referrals. Recruit 20–30 real candidates for the first validation cycle.

08 · TWO-WEEK EXPERIMENTS

Avatar vs text-only; generic vs personalized debrief; 5 vs 10 question sessions. Resolve product value questions before adding breadth.

09 · EVIDENCE RULE

Replace all placeholders with real user counts, quotes and analytics before submission. Demo-mode events are not external traction.
